EDUCATION

Chapman University
Bachelor of Science **2022 - 2026**
Software Engineering Major; **Business Administration** Minor

TECHNICAL SKILLS

Programming Languages: Python, C, C++, Java, SQL, C#, HTML, CSS
Frameworks & Tools: Django, REST APIs, Docker, AWS (EC2, ECS, ECR, S3, Cognito, DynamoDB, CloudWatch, VPC, Route 53, IAM), Git, CI/CD, Flask, Pulumi, .NET, Gitlab, Nexus, Vault, Terraform, Kubernetes, Jenkins, Prometheus, Grafana, Argo CD
Testing Frameworks: PyTest, JUnit, Xunit
Concepts: Data Structures, Algorithms, Object-Oriented Programming, Operating Systems, Agile (Scrum), Database Management, Software Development Lifecycle (SDLC), Infrastructure as Code (IaC), Networking
Development Environments: Visual Studio, UNIX/Linux, Jira, Confluence, Trello, Cursor, Ubuntu

EXPERIENCE

HOME LAB INFRASTRUCTURE & DEVOPS (Kubernetes, Jenkins, Prometheus, Grafana) **Sept. 2026 - Oct. 2026**

- Architected and administered an **Ubuntu Linux-based** home lab, using **Terraform** and **Infrastructure as Code** (IaC) to automate infrastructure provisioning and manage networking, compute, storage, and cluster resources through version-controlled configurations.
- Engineered automated **CI/CD** and **GitOps** workflows using **Jenkins** and **Argo CD**, integrating source control, container builds, automated testing, and declarative deployments with continuous reconciliation to automate application delivery to Kubernetes.
- Deployed and operated containerized applications on **Kubernetes**, managing deployments, services, persistent storage, configuration, secrets, workload scaling, and service availability across the cluster.
- Implemented full-stack observability with **Prometheus** and **Grafana**, collecting infrastructure and application metrics, building operational dashboards, and monitoring cluster health, resource utilization, and service availability.

FOUNDER & SOFTWARE ENGINEER (Dealsight AI) **April 2026 - August 2026**

- Designed, deployed, and operated a production SaaS platform across **AWS** and **Vercel**, including a containerized FastAPI backend on **ECS Fargate**, a **Next.js** frontend, **PostgreSQL**, **S3**, Pinecone, and multiple external APIs.
- Built and maintained cloud infrastructure covering **VPC** networking, private subnets, security groups, service configuration, **DNS**, environment management, cloud storage, and secure API integrations.
- Established **CI/CD** workflows using **GitHub Actions**, automated testing, branch protection rules, and deployment checks to improve release reliability and prevent production regressions.
- Managed application reliability, performance, and cloud costs by configuring **ECS** capacity, controlling concurrent processing jobs, optimizing resource usage, and troubleshooting production issues across containers, authentication, networking, and API routing.
- Engineered scalable document processing pipelines for bulk ingestion, parsing, OCR fallback, document chunking, vector indexing, retrieval, and AI analysis of virtual data rooms containing thousands of files.
- Implemented operational and security controls including authentication, access management, audit logging, billing workflows, data storage, failure handling, and source traceability for AI generated reports.
- Owned the complete infrastructure lifecycle from local development and testing through production deployment, incident debugging, system maintenance, and continuous platform improvement.

SOFTWARE ENGINEERING INTERN (Dry Scientific Inc) **June 2025 - August 2025**

- Implemented **CI/CD pipelines** using **GitLab** to automate the build and deployment for **Ubuntu-based** container environments.
- Created scripts to build **Ubuntu-based Docker** images and push them to a Nexus repository, reducing manual intervention and deployment errors.
- Automated the build and push of **Docker** files for **MySQL** and **PostgreSQL** testing, followed by automation of pulling, running, and testing connections to the databases, enabling consistent and reliable test environments.

WORKOUT TRACKING AND DIET PROJECT (Python, Django, AWS, Docker, Git) **December 2024 - May 2025**

- Developed a backend system using **Django**, **AWS**, and **Pulumi** integrating **S3** for **data storage** and **Cognito for authentication**.
- Designed and deployed a **CI/CD pipeline** using **GitHub Actions**, **Docker**, and **AWS ECS**, reducing deployment time by **40%.**
- Implemented a **REST API** to fetch exercise data and optimize response times, improving performance by **20%** through caching.
